

Protect your roof while maintaining the original, natural look of the tiles.

proPERLA® **Water Repellent**

Clear treatment for mineral building surfaces.

BEFORE

AFTER

The benefits of applying it

The tiles is able to breathe and will be permeable to water vapour. Air and moisture pass through from one side to the other.

Dirt particles are simply washed off with the next rain and the surface becomes self-cleaning.

It will look clean and new at all times and no signs of deterioration will appear.

Water is not able to remain on a waterproof surface. Therefore no moss, algae, lichens and other microorganism can grow.

Comes with a 10 year manufacturers guarantee and a 25 year life expectancy.

Water repellent

You will recognise the excellent water repellent properties by its beading behavior. It will make the masonry dry and extremely resistant to biological hazards, mould, mildew, etc. A dry masonry will improve the thermal resistance, prevent frost damage and reduce the growth of microbial spores.

Self cleaning effect

Dirt particles are unable to obtain a hold on the proPERLA® coated facade and will simply flow off with rainfall. The façade remains clean and attractive, even on sides which are particularly exposed to the weather like on the north-facing side or facades in shade, as well as in areas with high air humidity or sea salt penetrated air.
